UNINTERRUPTED
PRODUCTION

WATERJET
MADE EASY

LEAVE IT TO
THE EXPERTS

STEP 1

Before Production Shift -
Remove Top-Works and
ship to **BACA** care team

STEP 2

Install professionally
rebuilt intensifier

STEP 3

Return to Production -
get back to making \$\$\$

We understand - you want to concentrate on your business. The **Waterjet Made Easy** program allows intensifier maintenance to be completed to the highest standards in the industry by trained technical staff, freeing you from having to maintain the largest and most complex part of your water jet system.

The **Waterjet Made Easy** package includes a complete high-pressure top-works assembly, tools for removal and install, and a robust shipping case. Having a spare unit on your shelf will make it so you don't have to run in a failed state. It takes only 15 minutes to swap out with the spare assembly on site. The assembly that requires maintenance is then shipped to BACA Systems for repair. Once your waterjet top works assembly is received, an expert BACA Systems technician will rebuild the assembly,

replacing all worn components and evaluating wear points throughout the rebuild. All seals, o-rings and check valve components are replaced, and the check valves main bodies are lapped. The assembly is then tested at full pressure. The repaired assembly is then shipped back, making it ready for swap out on the pump in the future.

BACA Systems has made it Easy - when your high pressure assembly show signs of needing service, you will simply replace it with your standby assembly and send BACA Systems the unit that needs to be rebuilt. Within five business days BACA Systems will completely rebuild the assembly, test at full pressure and ship it back to you. **WaterJet Made Easy.**
